Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/660,183

Applicant(s)

PERROT ET AL.

Examiner

SABA TSEGAYE

Art Unit

2419

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 April 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1 and 3-16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1 and 3-16 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/CDC)
- Paper No(s)/Mail Date _____

- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(c), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(c) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 04/30/09 has been entered. Claims 1 and 3-16 are pending. Currently no claims are in condition for allowance.

Claim Rejections - 35 USC § 103

2. Claims 1 and 3-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bender et al. (WO 00/18066) in view of Joy et al. (US 2005/0157732 A1) and The Admitted Prior Art ("APA") as disclosed in applicant's specification Fig. 1, page 1 line 12-22.

Regarding claims 1 and 15, Bender discloses a method for connecting a device (40) not having wireless communication capability to a wireless network; characterized, at the level of a bridge device (42) comprising means for interfacing with the wireless network (56) comprising and access point (58, 60) (see fig. 4), by the steps of:

detecting a connection between the device and the bridge device (page 8, lines 1-25);

determining an address (*when power initially applied to the terminal equipment unit 40 and the wireless modem 42, each of them has a **unique hardware address**...message (that specifies the terminal equipment units permanent hardware address) is broadcasted to the*

network remote server 60) for the device and for the bridge device (page 9, lines 28-31; page 11, lines 3-5; page 10, lines 19-23);

separately registering to the access point, with the respective addresses, the device and itself as wireless devices on the wireless network (page 9, lines 7-12; page 10, lines 19-23; page 11, lines 3-7).

Bender discloses, as pointed out above, when a terminal equipment unit is first powered on, it broadcasts a message intended for the network remote server 60. The broadcast message specifies the terminal equipment unit's permanent **hardware address** to request an IP address. Furthermore, it is well known that a MAC address is a hardware address that uniquely identifies each node of a network. Bender does not expressly disclose that the hardware address is a MAC address.

Joy teaches that MAC address (Ethernet address) is a unique address used on a network in order to ensure that a given packet will arrive at the correct destination (0005).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to substitute a MAC address, such as that suggested by Joy, for the hardware address of Bender in order to ensure that a given packet will arrive at the correct destination, thereby providing a secure system.

Further, Bender does not expressly disclose wherein the registration is performed through an authentication and an association process of the type as defined by the IEEE 802.11 standard.

However, Bender discloses, on page 13, lines 19-20, that the wireless link connection may operate under one of a plurality of well known or later developed operating protocols.

Further, Bender discloses that a standard IP suit system connecting the wireless modem 42 and a network unit 58 over a wireless link 56. The IP suit may be used to internetwork a diverse range of LANs and WANs (page 6, line 27-page 7 line 5).

APA discloses that it is well known for wireless network to use the IEEE 802.11 specification to allow stations on the wireless network to exchange data.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use IEEE 802.11 standard in the system of Bender in order to use a set of standard for wireless LAN to exchange data.

Regarding claim 3, Bender discloses the method further comprising the step of having the bridge device monitor traffic on the wireless network for the device (see fig. 4)

Regarding claim 4, Bender discloses the method further comprising the step of programming packet filters for packets having as destination address the address of the device, and upon detection of such a packet, acknowledging receipt of the packet in place of the device (page 12, lines 3-14).

Regarding claims 5 and 6, Bender discloses the method further comprising at least one of the following steps: forwarding all multicast packet on the wireless network from the bridge device t the connected device; forwarding all broadcast packets detected on the wireless network from the bridge device to the connected device; forwarding unicast packets on the wireless network having as destination the address of the connected device to that device (page 5, lines 6-20).

Regarding claims 7-9, Bender discloses the method where the connection between the device and the bridge device is an Ethernet connection, and wherein the step of detecting the connection comprises monitoring packets on the Ethernet connection for detecting a previously unknown source address of and Ethernet device (page 6, lines 8-14).

Regarding claims 10-13, Bender discloses the step of maintaining a single management information base for both the bridge device and the connected device (see Fig. 3a; the transceiver 44 comprises a standard Ethernet communication card; the transceiver 46 typically comprises a wireless link communication module; **the processor 48 interfaces with transceivers 44 and 46 as well as a memory unit 50**).

Regarding claims 14 and 16, Bender discloses bridge device (42) comprising means for communication on a wireless network (56) and for connection of a first device (40) not having wireless communication capability (Ethernet connection) to a wireless network comprising an access point (58, 60), the bridge device comprising:

means for determining an address (*when power initially applied to the terminal equipment unit 40 and the wireless modem 42, each of them has a **unique hardware address**...message (that specifies the terminal equipment units permanent hardware address) is broadcasted to the network remote server 60*) of the first device and of the bridge device (page 9, lines 28-31; page 11, lines 3-5; page 10, lines 19-23);

means for carrying out two separate device registrations on the wireless network, one for the bridge device, and one for the first device, using respective addresses (page 9, lines 7-12; page 10, lines 19-23; page 11, lines 3-7).

Bender discloses, as pointed out above, when a terminal equipment unit is first powered on, it broadcasts a message intended for the network remote server 60. The broadcast message specifies the terminal equipment unit's permanent hardware address to request an IP address. Furthermore, it is well known that a MAC address is a hardware address that uniquely identifies each node of a network. Bender does not expressly disclose that the hardware address is a MAC address.

Joy teaches that MAC address (Ethernet address) is a unique address used on a network in order to ensure that a given packet will arrive at the correct destination (0005).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to substitute a MAC address, such as that suggested by Joy, to the hardware address of Bender in order to ensure that a given packet will arrive at the correct destination, thereby providing a secure system.

Further, Bender does not expressly disclose wherein the registration is performed through an authentication and an association process of the type as defined by the IEEE 802.11 standard.

However, Bender discloses, on page 13, lines 19-20, that the wireless link connection may operate under one of a plurality of well known or later developed operating protocols. Further, Bender discloses that a standard IP suite system connecting the wireless modem 42 and a network unit 58 over a wireless link 56. The IP suite may be used to internetwork a diverse range of LANs and WANs (page 6, line 27-page 7 line 5).

APA discloses that it is well known for a wireless network to use the IEEE 802.11 specification to allow stations on the wireless network to exchange data.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use IEEE 802.11 standard in the system of Bender in order to use a set of standard for wireless LAN to exchange data.

Response to Arguments

Applicant's arguments filed 04/30/09 have been fully considered but they are not persuasive. Applicant argues (Remarks, page 8) that "*the network unit 58 and network remote server 60 do not constitute a wireless network. Accordingly, the access point of Bender is not an access point of a wireless network.*" Examiner respectfully disagrees with Applicant assertion. Bender clearly shows that the communication between the wireless modem 42 and network unit 58 is wireless. Further, Bender discloses that the wireless modem 42 is defined as a gateway between the Ethernet subnet and the external network (page 10 lines 22-23).

Furthermore, Applicant argues that *Bender fails to disclose or suggest at least a wireless network comprising a wireless access point*. However, a *wireless access point* is not specified in the claim language or specification. As shown in fig. 2 of the present application, the access point 26 is connected to a wired sub-network 22, which is not a wireless access point. Bender also shows, in Fig. 3, that the terminal 40 and the wireless modem 42 are connected to network unit 58 through the wireless network and the network 58 is associated with a network server 60.

Applicant, further, argues that neither Bender, the APA, or Joy discloses or suggest that the device and the bridge device are separately registered to the wireless access point with their respective MAC addresses as wireless device on the wireless network. Examiner respectfully disagrees with Applicant contention. Bender clearly discloses that "... the terminal unit 40, as well as the wireless modem 42, must be assigned an IP address so that each may be addressed

individually within the system... in addition, the use of independent IP addresses allows the terminal equipment unit 40 and the wireless modem 42 to exchange IP messages intended for one another.” See page 9, lines 8-12.

Applicant argues (Remarks, page 9) that in the present specification it is indicated that some adaptation is necessary in a bridge device to support the registration method of the claimed embodiment...” While this may be true, the claim language is much broader and the Examiner believes that the combination of Bender, Joy and APA disclose the limitations of these broadly worded claims.

Applicant is reminded that according to section 2106 of MPEP, “Office personnel are to give claims their broadest reasonable interpretation in light of the supporting disclosure. In re Morris, 127 F.3d 1048, 1054-55, 44 USPQ2d 1023, 1027-28 (Fed. Cir. 1997). Limitations appearing in the specification but not recited in the claim are not read into the claim.”

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SABA TSEGAYE whose telephone number is (571)272-3091. The examiner can normally be reached on Monday-Friday (7:30-5:00), First Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner’s supervisor, Pankaj Kumar can be reached on (571) 272-3011. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
